Shop Pilot AI: Team Setup Guide

Oct 17, 2026 · @Ritesh

Run the app on your laptop in 4 steps. Use Windows PowerShell.

You need: Node.js 20+, Git, and a MongoDB connection string. The admin sends you the string privately (shared Atlas database), or use local MongoDB: `mongodb://127.0.0.1:27017/shop_pilot`.

1. Clone

```
git clone <repo-url> C:\shop-pilot
```

2. Backend (terminal 1)

```
cd C:\shop-pilot\backend
npm install
Copy-Item .env.example .env
notepad .env
```

Set these in `.env`, then save:

```
PORT=4000
MONGO_URI=<connection string from the admin>
JWT_SECRET=<any long random text>
CLIENT_ORIGIN=http://localhost:5173
```

```
npm start
```

You should see `Database connected successfully`. Check `http://localhost:4000/api/health`: it should say `ok`.

3. Frontend (terminal 2)

```
cd C:\shop-pilot\frontend
npm install
Copy-Item .env.example .env
npm run dev
```

4. Open the app

Go to `http://localhost:5173`.

If something fails

- **MongoDB will not connect (Atlas):** ask the admin to add your current IP in Atlas Network Access.
- **No products or categories:** the admin must import `Predictions.csv` once with `npm run import` in the backend.
- **Page has no styling:** in `frontend`, delete `node_modules`, run `npm install`, and check that `npm ls tailwindcss` shows 3.x.
- **After editing any `.env`:** stop the server with Ctrl+C and start it again.

Never commit `.env` files or share the connection string publicly.
